DIY Emergency Light Made From A Disposable Camera & CFL Bulb

Categories : DIY, General Prepping

I love this little DIY/emergency preparedness project. It initially appears quite complicated to do, but it's not, it is really quite simple. All you need is a cheap disposable camera (for the electronics), a CFL bulb (low energy bulb) and some kind of housing to hold it all together.

I think this is more of a fun/cool project to do rather than a serious emergency preparedness DIY project. That said, a little battery powered light like this would come in handy when the power is out etc. I think you would certainly use it if you had made one. Also if housed in a clear watertight housing it could also be used outdoors for camping etc. Check out the build tutorial below.
