This is not the first time we have featured a method of vertically growing potatoes. In fact I tried this method last year with great success. However, I think this new method is far superior, as it allows the potato plants to grow out of the sides, rather than just from out of the top like the previous method. I had a good crop of potatoes last year, but I think the yield will be even greater with this method of growing. I plan on building several of these DIY potato towers right away!

If you are short on space and want to grow some potatoes, I highly recommend heading over to 'Growing Lots Urban Farm' on the link below, and check out their tutorial on how to build and use these potato towers.

DIY Potato Tower: Grow 25 lbs Of Potatoes In No Space At All
