

## Easy To Make PVC Tube Drying Rack

Categories : [DIY](#), [General Prepping](#), [Homesteading](#)

Sometimes the simplest way to way to do something is the best way, and using a drying rack is one of the simplest and easiest ways to dry/dehydrate food for long term storage. Below is a nice photo tutorial showing how to build a drying rack from some PVC tubing, some outlets and adapters and some hardware cloth (chicken wire). The hardware cloth is galvanized, so I am not sure how great that is for putting food on, but I think you could substitute this with that plastic mesh you can use to cover crops to keep insects away, this would probably also be cheaper!

Other than how cheap and easy it is to build, the great thing about this PVC drying rack is that the legs come off, which makes it very easy to store when not in use...
