How To Make A GREAT Rocket Stove From Some Tin Cans

Categories : Cooking, General Prepping

Rocket stoves are very efficient, they burn little fuel, but give off a huge amount of heat for their size, this makes them great for cooking on. This particular rocket stove (from minimalistsurvival) is mainly for home use, it would make a great back-up stove in case of power cuts or natural disaster. It would also make a nice little side stove to compliment a barbecue in the summer.

It is fun to make stoves like this from trash, they cost nothing to make and you genuinely make something useful. You'll be glad to have one when the power goes off... Make one, test it out, have a play and then store it in the garage so it's there when you need it.

By the way, head over to minimalistsurvival's YouTube channel for some more great videos.
