Most of us have WiFi in our homes these days; lots of us are tech-savvy, but many are not... If your home WiFi network is unsecured, it means that pretty much anyone can sit within 30-50 meters of your home and use your WiFi network to access the internet. For example, your next door neighbour could be piggybacking and using your WiFi right now...

Worse than this though is the fact that hackers and criminals can use your unsecured WiFi network to access your personal/banking details to use for fraudulent purposes. If you are unsure whether your home’s WiFi network is secure or not, I highly recommend you check out the article below
which lists the simple steps you can take to make your network more secure. Even if you think your network is already secure, I recommend checking it is as secure as it could be.

How to Secure Your Home’s Wireless (WiFi) Network
