Simple Vertical Gardening Method

Categories: DIY, General, Growing your Own

Last week we posted a video about vertical gardening using old plastic barrels. You effectively cut slots into the sides of the barrels (for planting the plants) and put a length of drain pipe down the center for adding compostable food waste, which is then broken down, and feeds the plants.

The method details below is essentially the same, but rather than having to acquire and cut all the barrels, you simply use 2 by 4 inch mesh wire and weed matting. The drain pipe goes down the center as before. I think this method is much easier to set up than the barrel method, but you decide as now you have a choice!
