

## Spiders, Roaches, Ants & More; Get Them Out Of Your Home With A 100% Natural/Safe Product

Categories : [General](#), [Homesteading](#)

Firstly to clarify things, bugs are great when they live outdoors, they serve an important and vital purpose in nature. This post is intended for people who have a home infestation or a phobia of spiders etc. Outside I say live and let live, but if you have bedbugs, [fleas](#) or cockroaches etc invading your home, in and around your food and kids, it's a different matter.

What if I told you there is a natural product that will get rid of ALL of the above? In fact, it will kill any bug with an exoskeleton, so that covers most of the other bugs we don't like too. This product is 100% natural, non-toxic to humans and mammals, and safe to use around kids and pets, it's also inexpensive. Want to know what it is? **It's called [Diatomaceous Earth](#)**. Diatomaceous Earth (sometimes called diatomite) is the fossilized remains of hard-shelled algae (known as diatoms). It is 100% natural and looks like an off-white talc powder.

### **How does it work and where to use it**

The way it works is simple - diatomaceous earth sticks to the bugs and absorbs the lipids from their

exoskeleton which causes them to quickly die through dehydration. Most, apart from beetles, will die within 24 hours.

To get rid of all these critters from your home, simply sprinkle the DE powder in the places where they are getting into your home and hiding. Some of the best places to use it are around doorways, windows and air ducts - and sprinkle it under all of your furniture. You can also use [diatomaceous earth](#) directly on ants' nests if they are too close to the house. Whether you use it indoors or out, it is vital that you keep DE dry as it becomes ineffective when it gets wet.

### **What to buy and where to get it**

When buying diatomaceous earth, you want to make sure you buy 'food grade' [diatomaceous earth](#). There are other types of diatomaceous earth such as 'pool grade' that can contain added ingredients which may be harmful. 'Food grade' diatomaceous earth is totally non-toxic to humans and mammals. In fact it is often mixed in with grain-based food to keep it safe from bugs.
