Start a Fire With Steel Wool & 9 Volt Battery

Categories: Urban Survival

There are so, so, so many ways to start a fire, but this is a totally new one for me! Lot of us have steel wool and 9 volt batteries at home. Follow the instructions in the video and then if you are ever at home in an emergency survival situation you would be able to start a fire in your back yard to cook on and sterilize water with steel wool and a 9 volt battery. Pretty cool!

It is a good idea to always have the knowledge and ability to be able to make fire several different ways, just in case one method fails. Matches get wet and lighters fail/run out of fuel. Add a few different ways to start fire manually to your skill-set. It is an excellent confidence booster to know you can start a fire in any situation.
